1 - INTRODUCTION

1 - INTRODUCTION

This report has been prepared to assist the Ontario Ministry of the Environment (MOE) in a review of polynuclear aromatic hydrocarbons (PAH) undertaken for the purpose of setting environmental standards. The objective of this report is to present a bibliography of recent literature on this group of compounds.

The bibliography exists in printed and electronic versions. The printed version is included in the present report. The electronic version is held by the MOE's Hazardous Contaminants Coordination Branch.

A brief summary of the methods used to prepare this bibliography is given in Section 2 of this report. Then the printed bibliography is presented, with citations arranged in nine broad subject categories. The bibliography is followed by an author index and a keyword title index. This bibliography includes reference citations, but not abstracts. Abstracts are arranged by citation number in a separate volume held by the Hazardous Contaminants Coordination Branch.

2 - METHODS

2 - METHODS

2.1 - Search Strategy Development

The initial approach to this endeavour was to try to achieve broad retrieval of references published between January 1, 1982, and early 1986. The original intention was to retrieve all relevant citations from over 30 online databases for a complete range of PAH compounds.

The references cited in Table 1 were reviewed and a keyword list of environmentally or biologically important PAHs was developed. The PAH Bibliography Working Group of MOE reviewed this keyword list and designated 30 specific PAH compounds for inclusion. The modified keyword list served as the starting point for developing the detailed search strategies ultimately employed.

Over 30 databases were originally considered for inclusion in this study (Table 2). Preliminary search strategies, comprising general terms such as "polynuclear aromatic hydrocarbons", were implemented on most of these databases for the period January 1, 1982 to early 1986. More detailed search strategies, consisting of Chemical Abstracts Service (CAS) registry numbers, were implemented for the same period on a few databases accessible using CAS registry numbers. The numbers of potentially pertinent references identified with these preliminary search strategies are shown in the center column of Table 2.

The total number of references identified during these preliminary searches was much higher than the number that could be retrieved and processed with the resources available to the project. Consequently, the original, broad retrieval approach was modified to a more limited approach that met the basic needs of the PAH Bibliography Working Group. The following specific limitations were imposed.

- Search strategy not implemented.

* The search strategies consisted of CAS registry numbers of the PAH compounds designated by the MOE as of primary concern. All the other preliminary search strategies consisted of general terms such as "polynuclear aromatic hydrocarbons".

- 1 - The period of concern was limited to January 1, 1984, to early 1986.
- 2 - The number of databases to be searched was reduced to 15.
- 3 - The list of specific PAHs to be included in the search strategy was limited to those of primary concern to the MOE.
- 4 - Citations related strictly to chemical analytical procedures were omitted.
- 5 - Acronyms and general terms that retrieved irrelevant citations were omitted from the search strategies.

The results of the more limited approach are shown in the last column of Table 2.

Table 3 gives the CAS Registry Numbers and compound names used to retrieve references on PAH compounds. Each entry includes the CAS Registry Number (CRN) plus the CAS name(s) and most common synonyms obtained from the CHEMNAME database on DIALOG. Some entries include only the CRN plus a general compound name, for in these instances, use of the name of the general class of compounds retrieved references on all specific compounds whose names included the class name. For example, using "Dinitropyrene" retrieved references on 1,6-Dinitropyrene, 1,8-Dinitropyrene and any other dinitropyrenes. For the same reason, the lists of synonyms are not necessarily comprehensive, because some synonyms contained strings that had already been searched.

Chemical Abstracts Service (CAS) registry numbers plus all general terms in Table 3 were used on CA Search, Chemical Exposure and MEDLINE. The search strategy used on CIS/ILO consisted of CAS registry numbers plus descriptors from the list of index terms for this database. To

GENERAL TERMS

Polycyclic aromatic hydrocarbon(s)
Polynuclear aromatic hydrocarbon(s)
Polyaromatic hydrocarbon(s)

determine the preferred search terms on EMBASE, the online thesaurus was used and only thesaurus terms were included in the EMBASE search strategy. The search strategies used on ASFA, COAL, CODOC, ELIAS, FSTA, IEC, NTIS, and OON consisted of spelled-out compound names and general terms, with date restrictions imposed as applicable to each database. This search strategy, along with an additional search strategy of segmented terms, was used on BA79 and BA86. The terms to be segmented were selected by consulting the Biosis Search Guide and experimenting online. Toxline was searched by the Health Science Resource Centre of the Canada Institute for Scientific and Technical Information (CISTI) using a search strategy developed from CAS Registry Numbers provided by Acres.

2.2 - Bibliography Preparation

Permission was obtained as necessary to download, retain online and copy citations. References were retrieved through the database vendor systems shown in Table 4.

Citations were downloaded electronically from all databases except Toxline using an IBM PC. Toxline citations were retrieved electronically by CISTI and the printouts were forwarded to Acres for manual entry into the bibliography. The software package used for the electronic bibliography was the REF-11 reference database management system produced by D.G. Systems. Once all the citations had been downloaded, a set of 7 BASIC programs extracted the required information for entry into the bibliography. These 7 programs read the data from the following databases: MEDLINE, EMBASE, COAL, NTIS, CA Search, ASFA, and BA79 and BA86. The programs then coded the information in a standardized format that could be read by REFRD program (supplied by D.G. Systems).

Abstracts were downloaded electronically from many of the databases and then printed on a laser printer. These abstracts were deleted from the magnetic disk after they had been printed. Abstracts from BA79 and BA86, ASFA, COAL, FSTA and NTIS were received offline in printed form.

When all citations had been entered into the electronic bibliography, they were processed as follows.

- 1 - Many citations had been retrieved from more than one database. As a result, there was more than one version of many citations in the electronic bibliography. The bibliography was sorted by authors' names on a computer and the sorted bibliography was examined manually for duplicate citations. When duplicates were found, the most comprehensive version was retained and the other(s) were deleted from the electronic bibliography. Approximately 30% of the citations retrieved from online databases turned out to be duplicates.
- 2 - After duplicate citations had been deleted, the remaining citations were examined and each was assigned to one of the following broad subject categories.
 - Chemistry and Analysis
 - Environment
 - Pollution
 - Biology
 - Toxicology
 - Health and Safety
 - Waste Disposal
 - Legislation
 - Bibliography

This assignment was done by inserting the subject category into one of the 'topic' fields in the REF-11 bibliography in order that

REF-11 could be used to retrieve all citations in any given subject category.

- 3 - Citations that did not fall into any of the above subject categories or did not conform to the limitations imposed on the search strategy were deemed to be irrelevant and were deleted from the electronic bibliography. The following were the principal kinds of citations that were deemed irrelevant.

- On several of the databases, retrieval could be limited by the date the citation was entered into the database but not by the publication date. As a result, many references were retrieved that had been published before January 1, 1984, but entered into the database after that date. As January 1, 1984, had been established as the earliest publication date for inclusion in the PAH bibliography, these citations were not included.
- Citations dealing with process research for coal liquefaction, coal gasification or petroleum refining were not included.
- Citations dealing with the more theoretical aspects of PAH chemistry, such as stereochemistry or molecular structure, were not included.
- Citations dealing with the more theoretical aspects of PAH analytical chemistry were not included unless it seemed likely that the reference would contain data on levels of PAH in sources or environmental media.
- Citations dealing with purification or synthesis of naturally occurring plant PAHs, such as alkaloids, were not included.
- Citations dealing with the medicinal use of PAHs as anti-tumor agents or antibiotics were not included.

- Citations dealing with the use of PAHs as fluorescent dyes were not included.
- Citations dealing with compounds not on the list of environmentally or biologically important PAHs established by the MOE were not included.

Approximately 40% of the citations retrieved were judged to be irrelevant.

- 4 - Keywords were assigned to each citation by including them in the REF-11 'Topic' field. Significant words in the citation title were chosen as keywords. Also included as keywords were the most relevant of the keywords retrieved along with a citation from the online database. When keywords had been assigned, a keyword list was prepared and some keywords were changed to eliminate repetition of similar headings in the keyword index.
- 5 - Citations were edited to achieve uniformity of bibliographic format. A combination of manual and computer methods was used in this editing process.

When the electronic bibliography was complete, it was used to create the printed bibliography. An author index and a keyword title index were prepared to accompany the printed bibliography.

To produce these indexes, REF-11 was used to create files containing the author, keyword, and title information. BASIC programs then read the REF-11 output and altered it to a format that would permit sorting of authors' names and keywords in alphabetical order. The sorting was done using a text editor. Additional BASIC programs then read the modified author, keyword, and title files and wrote the information in the format requested by MOE. Final revisions to the indexes were made with a text editor.

The printed abstracts were numbered to correspond to the entry numbers in the bibliography and were bound in numerical order in a separate volume.

3 - BIBLIOGRAPHY

NOTE: An asterisk (*) beside the citation number in the bibliography indicates that an abstract is available in the separate abstract volume.
